

FAQ

How long does the tan last?

Depending on a persons activities and skin type, the tan lasts approximately 5-10 days. With follow up applications you can maintain the tan infinitely.

Can A-Tan be removed?

The colour produced by A-Tan does not wash off. It simply fades as the upper layers of the epidermis wear away. You can try to speed up the exfoliation process gently scrubbing the skin with a washcloth or loofah sponge. DO NOT OVER SCRUB! It may take a week or more for the 'tanned' skin to disappear.

Does A-Tan provide SPF protection?

No. Spray tans do not provide any sunscreen protection, so you should apply sunscreen accordingly. Your skin will appear tanned, even though its not. It is important to use lotion with SPF to protect you from the sun's harmful rays.

What is the advantage of A-Tan over UV tanning?

Spray tanning is a safe alternative to sunbeds and sunbathing. One application will be equivalent to 6 tanning bed sessions. Spray tanning also avoids the risk of potential burns caused by the sun or tanning beds.

How is A-Tan applied?

Each person is airbrushed privately with the option of wearing a bathing suit or underwear depending on your own level of comfort. A technician will apply a quick drying mist, sprayed onto the body. Approximately 5 minutes after application you can get dressed. Allow a minimum of 8 hours for the tan to develop... leaving you with a gorgeous natural looking tan.

Shades available are:

Fair 8% DHA

Beautiful natural light bronze for fair skin

Medium 10% DHA

Golden off the beach look. Ideal for medium skin types

A Tan

A-Tan is specially formulated using paraben-free natural ingredients of the highest quality. Our tanning solutions are fortified with extra moisturisers including Aloe Vera, vitamins A, B and E (to protect and nourish your skin) and Erythlose. One application will develop a deep, long lasting tan that fades evenly and dries non-sticky in minutes. A-Tan has a gorgeous colour guide and exotic coconut fragrance suitable for male and female clients.

A-Tan contains no drying alcohol and will give you a 'streak free' gorgeous tan. The main active ingredient in A-tan is dihydroxyacetone (DHA) which reacts with amino acids on the outer most layer of the skin. This natural reaction causes the colour of the skin to change and develop to a darker shade.

Precare

1. Exfoliate thoroughly and moisturise the day before your tan is applied. This will remove dead skin and provide a new, smooth surface for your tan.
2. On the day of the treatment DO NOT moisturise, use makeup, deodorant or perfumes. These can affect the tan development or cause discolouration.
3. Shave or wax at least 24 hours prior to you're A- Tan application.
4. Wear dark loose fitting clothing and underwear. The cosmetic bronzer may rub off on clothing and stain light coloured nylon and lycra material.
5. Avoid wearing long boots as these can make your tan patchy on your legs.
6. Avoid wearing socks or shoes after your tanning session as sweating can inhibit the development of your tan. Sandals are a good choice of footwear.

Aftercare and Maintenance

1. Wait at least 8 hours before washing the tanning formula off. When you take a shower or bath you may see some colour wash off. This is quite normal and is only the colour guide washing off, not the tan itself.
2. Don't sit on light coloured fabrics until you you've showered or taken a bath. The colour guide can cause discolouration.
3. To maintain your tan moisturise regularly (use oil-free moisturiser). Do not moisturise until after your first shower or bath.
4. Avoid long hot showers and baths, and scrubbing the skin excessively. Pat your skin dry after bathing or showering. Do not rub.
5. Swimming (chlorine or sea salt), shaving and vigorous exercise may shorten the longevity of your tan and fade unevenly.
6. Your hands face and feet will fade quicker than other parts of your body.
